

Project Design Phase-II

Customer Journey Map

Project: Import Data using Transform Maps (Spreadsheet) **Persona:** ServiceNow administrator **Date:** 29 September 2026

	Entice	Enter	Engage	Exit	Extend
Scenario	The administrator receives a request to load employee data from Excel	Sets up the spreadsheet and the target table	Loads, maps and transforms the data	Checks that the records were created correctly	Handles repeat imports, reports and dashboard
Steps	Receive employee sheet with ID, name, email, department, location	Create Sample Spreadsheet.xlsx; create Employee Test table and five fields	Load Data to Employee Import; create Transform Map; Auto Map; click Transform	Open Employee Test list; personalise list columns; confirm success message	Enable Coalesce on Employee ID; import new sheet; create 3 reports; build dashboard
Interactions / Touchpoints	Email or file share; Google Sheets	Google Sheets; Tables > Create New; Form Layout	System Import Sets: Load Data, Transform Maps	Employee Test table list view	Transform History; Reports; PA_DASHBOARDS form
Goals & Motivation	Get the data into ServiceNow quickly	Have a correct source file and target structure	Move data accurately without manual typing	Be sure the data is complete and correct	Keep data clean over repeated imports and give HR visibility
Feelings	Concerned about effort and accuracy	Confident - steps are clear	Focused; relieved when the success message appears	Reassured when all records appear	Satisfied - no duplicates, clear charts
Pain points	Manual entry would be slow	Field types or names entered wrongly	Fields left unmapped	Missing or invalid values	Duplicates on re-import; dashboard form blocked by ACL
Opportunities	Standard Excel template for senders	Reusable table and sheet layout	Auto Map Matching Fields saves time	Validate mandatory fields before transform	Coalesce; ACL Admin Override; scheduled imports later

Stages follow the template's Entice - Enter - Engage - Exit - Extend structure.
